

Cayman-ToolboxErp

This version of the **erp2cayman** software is intended as an example of a simple connection of the Cayman software to an ERP system. The program is designed for companies in which a large number of different individual cables are assembled in variable quantities.

The software essentially carries out the following steps::

- Article, order number and quantity are determined from a simple Excel list.
- A Cayman file is searched for each individual article.
- A new Cayman file is created containing all articles with the desired quantity and a reference to the order.
- Optional: Inkjet labels are supplemented with order number + calendar week

Operation of the ERP2Cayman

Advantages

- Waste avoidance: Orders with identical raw material can be produced en bloc
- Set-up time optimisation
- Articles can be created as usual with Cayman
- The ERP system only has to create a list with article number + quantity
- Cable identification contains order number and production week

Potential extensions

- Sorting / splitting of production based on raw material
- Extension of the ERP file with order-dependent
 1. labelling texts
 2. cable lengths
 3. comments
- Customer-specific arrangement of marking texts on the cable
- Distribution of orders to different machines
